Appln. No. 09/527,634 Amdt. dated August 13, 2004 Amendment Under 37 CFR 1.116 Expedited Procedure Examining Group 2128

## Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

## Listing of Claims:

1. (Currently amended) A universal asynchronous receiver transmitter (UART) comprising:

a first-in, first-out (FIFO) buffer;

a shift register coupled to said FIFO buffer;

a serial transmission line, coupled to said shift register for connecting to a remote processor;

a circuit for detecting a last word transmitted from said FIFO buffer over said serial transmission line;

a transmitter empty circuit for generating a control signal, relating to the availability of said serial transmission line to receive data, on a control line when a last word transmitted from said FIFO buffer is detected;

a delay circuit for delaying generation of said control signal for a programmable delay time related to transmission characteristics of said serial transmission line; and

a programmable register for setting said programmable delay time, wherein said programmable register comprises a shadow register which is a write-only register with the same address as a read-only register only read by a user.

- 2. (Previously presented) The UART of claim 1 wherein said control signal is triggered from a stop bit of said last word.
  - 3. Canceled.
- 4. (Currently amended) The UART of claim 3 1 wherein said write-only register comprises the first four bits of a modern status register.
- 5. (Original) The UART of claim 1 wherein said programmable register is a four bit register.

Appln. No. 09/527,634 Amdt. dated August 13, 2004 Amendment Under 37 CFR 1.116 Expedited Procedure Examining Group 2128

6. (Previously presented) The UART of claim 1 further comprising:
a plurality of channels, each channel having said FIFO buffer, said circuit for detecting a last word and said transmitter empty circuit; and

said delay circuit and said programmable register being a single circuit and register connected to control the delay of said control signal for each of said channels.

7. (Previously presented) A universal asynchronous receiver transmitter (UART) comprising:

a first-in, first-out (FIFO) buffer;

a shift register coupled to said FIFO buffer;

a serial transmission line, coupled to said shift register for connecting to a remote processor;

a circuit for detecting a last word transmitted from said shift register over said serial transmission line;

a transmitter empty circuit for generating an RTS signal on an RTS control line when a last word transmitted from said shift register is detected, wherein said RTS signal is triggered from a stop bit of said last word;

a delay circuit for delaying generation of said RTS signal for a programmable delay time;

a programmable register for setting said programmable delay time, wherein said programmable register comprises a shadow register which is a write-only register with the same address as a read-only register only read by a user;

a plurality of channels, each channel having said FIFO buffer, said circuit for detecting a last word and said transmitter empty circuit; and

said delay circuit and said programmable register being a single circuit and register connected to control the delay of said RTS signal for each of said channels.

8. (Previously presented) The UART of claim 7 wherein said write-only register comprises the first four bits of a modem status register.

Appln. No. 09/527,634 Amdt. dated August 13, 2004 Amendment Under 37 CFR 1.116 Expedited Procedure Examining Group 2128

- 9. (Previously presented) The UART of claim 7 wherein said programmable register is a four bit register.
- 10. (Previously presented) The UART of claim 7 further comprising at least eight of said channels.
- 11. (Previously presented) The UART of claim 2 wherein said stop bit is detected in said shift register.
- 12. (Previously presented) The UART of claim 1 wherein said control signal is an RTS signal.
  - 13. Canceled.
